

# THE HOLY GRAIL FOREX STRATEGY FUNNEL FINDER

The definitive 10-step system to find robust,  
reliable and profitable Holy Grail settings  
through the MT4 Strategy Tester tool  
(suited for every EA)

By FRANCESCO NANO from Italy

Dedicated to Hector DeVille  
my unaware manual trading mentor

Special thanks to Alex du Plooy from Expert4x  
that introduced me in the EA word

## Risk Warning and Disclaimer

Forex involves a risk of loss. Please consider carefully if such trading is appropriate for you. Past performance is not indicative of future results. This content is for entertainment purposes only and do not constitute investment recommendations or advice. Trading foreign exchange carries a high level of risk and may not be suitable for all individuals. The high degree of leverage can work against you as well as for you. Before deciding to invest in foreign exchange or other markets you should carefully consider your investment objectives, level of experience and risk appetite. The possibility exists that you could sustain a loss of some, or all, of your initial investment. Therefore you should not invest money that you cannot afford to lose. In some cases, it is possible to lose more than your initial investment as it is not always possible to exit a market at the price you intend upon doing so. There are also risks associated with utilizing an Internet-based trade execution software application including, but not limited to, the failure of hardware and software. You should be aware of all the risks associated with investing in foreign exchange and seek advice from an independent financial advisor if you have any doubt. The information made available by this guide is for your general information and use and is not intended to address your particular requirements. In particular, the information does not constitute any form of advice or recommendation and is not intended to be relied upon by users in making, or refraining from making, any investment decisions. The author will not accept liability for any loss or damage, including but without limitation to, any financial loss, which may arise directly or indirectly from use of or reliance on such information either provided by him or others that participate in the services provided. Please use your own good judgment and seek advice from a qualified consultant, before accepting any of the information you are given. Past performance is not necessarily a guide to future performance.

# PREFACE (OR PROPHECY?)

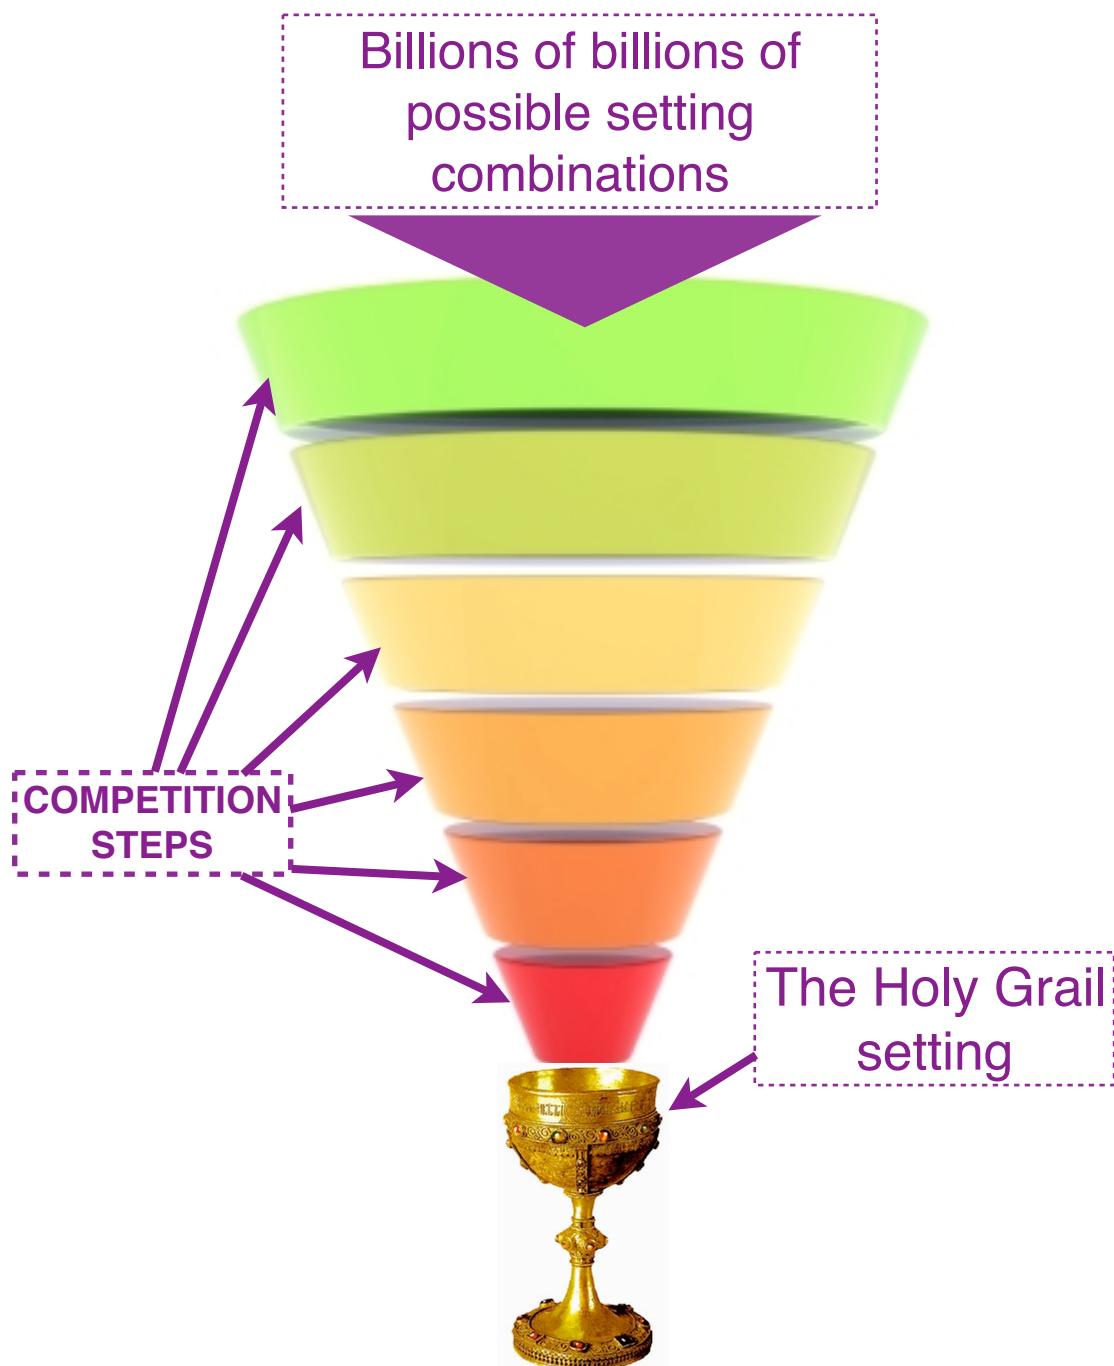

This brief manual is intended to help you in backtesting in finding out highly profitable and robust Forex Expert Advisor strategies through a solid and proven methodology. It was developed assembling many backtesting gurus courses' concepts and years of personal testing and discoveries. Before to start, let's have a look again at the manual's title:

Comparing this system to a “funnel” is the best and more intuitive way to understand the big picture of this method. To better explain the idea I'm going to use a metaphor.

How many people practice running all over the world? Millions? Billions? Ok, now let's imagine a new Olympic Running Games Worldwide Competition which is going to determine who is the best World Champion Runner. The task is to compare billions of runner through a "race steps competition funnel" in which steps could be pre-selections, selections, qualifications, set competitions and so on...

This is exactly what you're going to do thanks to this method: starting from billions of billions of potential parameter combinations, you are going to find the best World Champion Strategy (for a given EA running on a given symbol and timeframe).

**THE HOLY GRAIL FOREX STRATEGY FUNNEL FINDER** method evolves through 10 primary steps.

Many and many more steps could be added while researching the Holy Grail setup. However, these 10 are enough to start your “holy search” being sure you’re traveling in the right direction.

Anyway, my advice is to go through all these 10 steps at least a couple of time; after that, i encourage you to optimize this step-by-step strategy with your own devices and share with our [FREE FOREX BACKTEST COMMUNITY @ http://tiny.cc/ForexBacktest](http://tiny.cc/ForexBacktest) your updated procedure and the results you’re achieving with it.

**Just a prayer: please spread this ebook to the world by sharing it with all your forex trader friends and in every forum or community you frequent; this will let find better, more robust and even more profitable free forex strategies to share in the group, for the benefit of everyone!**

*Have a good backtesting and Forex money making!*

With Love!

*Francesco Nano from Italy*

## FOR WHOM THIS MANUAL IS

Although the backtesting topic is approached in this manual from a newbie perspective, leaving anything to the reader's interpretation and providing all details to move from a blank Strategy Tester to the Holy Grail setup, these pages are not conceived for a total Forex newbie.

Please, use the strategies provided only if you're skilled about:

- What is the Foreign Exchange Market (FOREX)
- What is JAPANESE CANDLES and how to read them out of chart
- What is a CROSS, PAIR OR SYMBOL
- What is a TIMEFRAME
- What is a PIP
- What is SPREAD
- What is a BROKER
- What is MT4 (and how to install and run)
- What is an EA (and how to install and make it work on a chart)
- What is a VPS (and how to use it for trading purposes)

You have to be extremely confident with these topics. If any of these points is not clear as the sun up to you, I recommend to move a backward step and have a little updating journey on Google.

# THE 2 BACKTESTING GOLDEN RULES

1.

**EVERY EA STRATEGY MUST EVER TO BE BACKTESTED AND CALIBRATED IN YOUR OWN “BROKER LOGGED-IN MT4 INSTANCE” RUNNING ON YOUR OWN PC OR VPS.**

**I repeat: Every EA strategy MUST ever to be backtested and calibrated in your own “broker logged-in MT4 instance” running on your own PC or VPS.**

Indeed, if you plan to profitably run any EA, consider that NO HOLY GRAIL FOREX STRATEGY SETTING could be provided to you from any other trader or from the himself EA producer: this is because every minimal and insignificant change in a single link in a trading chain (software, hardware, broker settings, account type, and so on) heavily affects ever the strategies performance.

2.

**NO HOLY GRAIL FOREX STRATEGY IS FOREVER! THEY EVER HAVE THEIR OWN LIFE CYCLE AND, ALTHOUGH UNPREDICTABLE, THEIR OWN EXPIRATION DATE.**

**I repeat: no Holy Grail Strategy is forever! They ever have their own life cycle and, although unpredictable, their own expiration date.**

Because, for itself nature, market constantly changes, If you’re going to trade an automatic Forex strategy you would have to consider that it doesn’t meter how well it has been backtested and how great it’s performing in live since the past weeks: it occasionally MUST be updated!

# DEFINITIONS

## METATRADER 4

"**METATRADER 4**, also known as **MT4**, is an electronic trading platform widely used by online retail foreign exchange speculative traders. It was developed by MetaQuotes Software and released in 2005. The software is licensed to foreign exchange brokers who provide the software to their clients. The software consists of both a client and server component. The server component is run by the broker and the client software is provided to the broker's customers, who use it to see live streaming prices and charts, to place orders, and to manage their accounts. The client is a Microsoft Windows-based application that became popular mainly due to the ability for end users to write their own trading scripts and robots that could automate trading." Wikipedia.org

## EXPERT ADVISOR

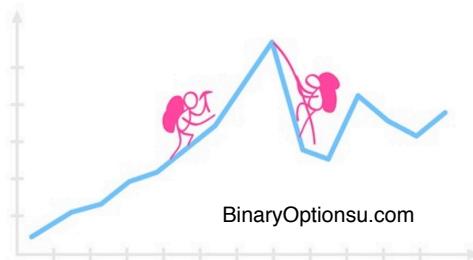

"The forex **EXPERT ADVISOR**, also known as **EA**, trading scripts or robot, is a program capable of performing in the terminal any action following the instructions of a trader, without his direct involvement. All tasks are performed automatically or mechanically, which is why the advisors are called experts or mechanical trading systems (MTS). Simply put, this is a program sending applications to a broker without any intervention on the part of the trader. You install a profit forex expert advisor to the existing forex online trading platform, which is connected to the server broker, adjust all the settings, and the advisor will begin trading according to a preset strategy." RoboForex.com

## BACKTESTING

"**BACKTESTING** is the process of testing a trading EA strategy on relevant historical data to ensure its viability before the trader risks any actual capital. A trader can simulate the trading of a strategy over an appropriate period of time and analyze the results for the levels of profitability and risk." Investopedia.com

## DRAWDOWN

“A **DRAWDOWN** is the peak-to-trough decline during a specific recorded period of a Forex investment. A drawdown is usually quoted as the percentage between the peak and the subsequent trough. Those tracking the entity measure from the time a retrenchment begins to when it reaches a new high.” Investopedia.com

## GENETIC ALGORITHM

“**GENETIC ALGORITHM** ( GA ) refers to the heuristic algorithm ( EA ), which gives an acceptable solution to the problem in the majority of practically significant cases, but the correctness of the decisions has not been proven mathematically, and is used most often for problems, the analytical solution of which is very difficult or even impossible.

A classic example of a problem of this class (class NP) is a "traveling salesman problem" (is one of the most famous combinatorial optimization problems). The main challenge is finding the most advantageous route, which passes through the given cities at least one time, and then returns to the initial city). But nothing prevents to use them for tasks, which yield to formalization.

EA are widely used for solving problems of high computational complexity, instead of going through all of the options, which takes up a significant amount of time. They are used in the fields of artificial intelligence, such as pattern recognition, in antivirus software, engineering, computer games, and other areas.

It should be mentioned that MetaQuotes Software Corp. uses GA in their software products of MetaTrader4 / 5. We all know about the strategy tester and about how much time and effort can be saved by using a built-in strategy optimizer, in which, just like with the direct enumeration, it is possible to optimize with the use of GA.” mql5.com

# HISTORICAL INTERPOLATED AND TICK DATAS

“In Forex, **HISTORICAL DATAS** are past information on the market performance of a currency pair. Historical data often include the opening, high, low and closing values over a specific period of time. Historical datas are often used to forecast future forex rate movements.”  
InvestorGuide.com

“Metatrader 4 backtesting uses prices that are randomly generated from bar data. By a process of interpolation, it uses the bar price data together with the tick count to generate the prices for each bar so that they start at the bar open price, touch the bar high and low, ending at the close price. If a position has both its SL and its TP within a bar's price range, it's a coin toss whether it will hit stop/loss or take profit.” [EAreview.net](http://EAreview.net)

“A **TICK** is a measure of the minimum upward or downward movement in the price of a security. A tick can also refer to the change in the price of a security from trade to trade.” Investopedia.com

Although using tick datas for backtesting purposes is not mandatory, they will of course improve your backtests reliability and will let you create more profitable strategies. The easiest and safest way to inject tick datas within the MT4 Strategy Tester is to use a third part application. I personally use [Tick Data Suite](#) and I suggest you do the same. You can contribute this ebook by signing up this amazing service through my affiliate link <http://tiny.cc/tickdatas> (much appreciated).

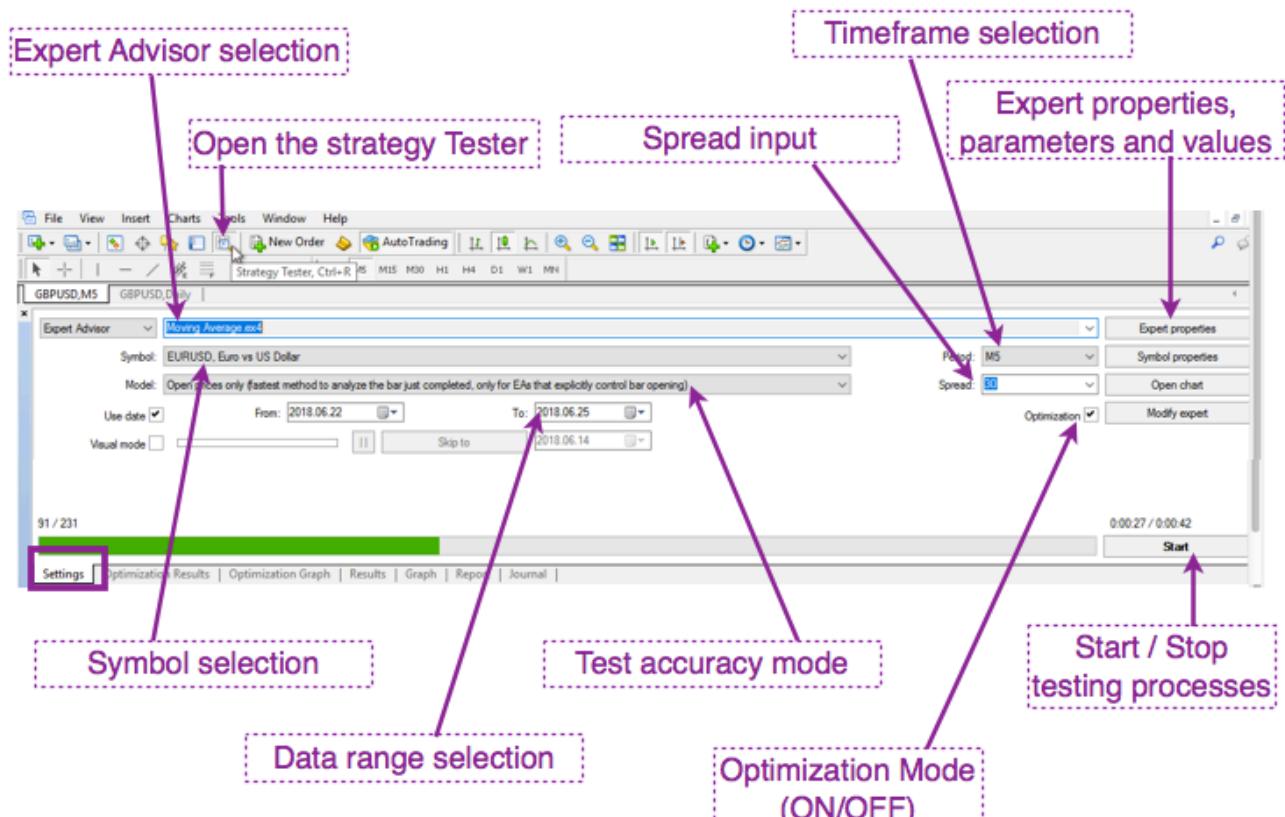

"With the [Tick Data Suite](#), actual price ticks are used. Nothing is left to chance - your backtests will use the prices that were historically traded and recorded tick by tick, oftentimes more than once per second."

[EAreview.net](#)

## THE STRATEGY TESTER TOOL

In FOREX TRADING, backtesting could generally be done through the MT4 STRATEGY TESTER tool (also known as Backtesting Tool or Backtester). This is exactly the tool we'll use all along these paragraphs so you need to understand it (at least at a basic level).

In the following scheme you can easily find the most important Backtester setting controls to start practicing with it. Read it and compare it with the Strategy Tester tool you'll find on your own MetaTrader4 application running on your PC or VPS...

... And when you're ready... LET'S START THE HOLY SEARCH!

# THE 10 STEPS

## STEP 1: CREATE THE CALIBRATION .SET FILE FOR YOU EA

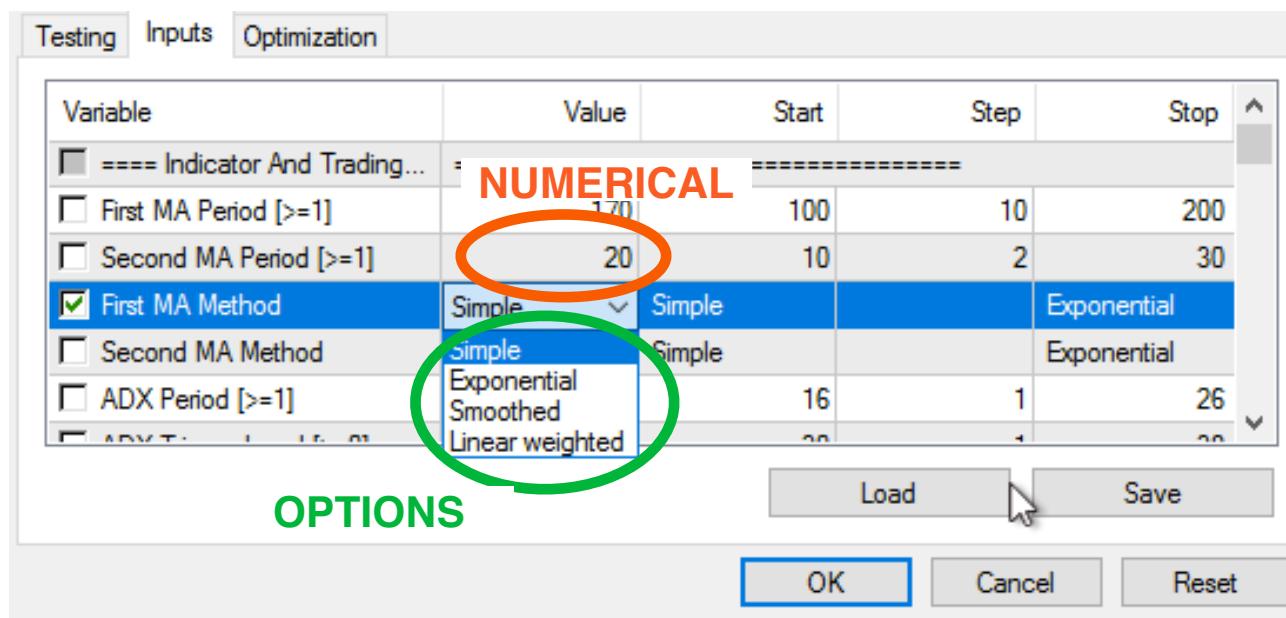

A calibration .set file is an input setting .set file that you can load in the Backtester Inputs tab. Saved parameter values are used to run a preliminary step of Genetic Algorithm Optimization through the Backtester Tool with the only purpose to determine:

1. if that EA could be profitable when used in any combination of symbol and timeframe
2. to have starting point setting values from which to start looking for robust and profitable settings through all the next optimization steps

If any calibration file is provided by the EA producer, then you have to create it by yourself. In this chapter you'll see how to do that.

Every Expert Advisor has its own settings parameters. Before to run any kind of optimization on an EA setting, we could decide if all parameters have to be tested during the optimization steps (it will produce more inaccurate results) or if to limit the optimization to a given number of parameters. I suggest to decide the main strategy by keeping fixed some parameters for all the following optimization steps, while optimizing others.

Basically, in the EA world there are only 2 kind of parameters: numerical and options.

Usually, options are part of main fixed strategy and numerical values are tested through all optimization steps that follows. Parameters you're going to optimize through the Backtester Tool in the next optimization steps, have to be checked.

In the following example, the EA parameter **First MA Period [>=1]** is checked because I decided to optimize it, so Strategy Tester will test it using values I arbitrarily provide: in this example, values are from 100 to 200 at steps of 10. Note that, if only this parameter would be checked, the Backtester would create 11 testing passes; all non-checked parameters will be kept fixed (**Value** column) during the optimization process while only **First MA Period [>=1]** would be changed at step of 10.

Variable	Value	Start	Step	Stop
<input type="checkbox"/> ===== Indicator And Trading...				
<input checked="" type="checkbox"/> First MA Period [>=1]	170	100	10	200

A calibration .set file is a setting file in which are saved all Inputs tab informations, including all fixed values (**Value** column) used for fixed parameters, the *to-optimize parameters* that have to be tuned (checked

parameters) and their testing range (start, stop and their relative optimization steps).

Usually, as you can see in the following example, a calibration file **Inputs** includes some *fixed strategy parameters* (non-checked), some *to-optimize parameters* (checked), very wide values ranges for *to-optimize parameters* (for example from 10 to 200) and large net steps (for example 10).

The screenshot shows a software interface for 'Calibration Inputs'. At the top, there are three tabs: 'Testing' (selected), 'Inputs' (highlighted in blue), and 'Optimization'. Below the tabs is a table with columns: 'Variable', 'Value', 'Start', 'Step', and 'Stop'. A header row indicates that the first column contains variable names and the second column contains their current values. The table rows are as follows:

Variable	Value	Start	Step	Stop
<input type="checkbox"/> ---- Indicator And Trading ...				
<input checked="" type="checkbox"/> First MA Period [≥1]	170	10	10	200
<input checked="" type="checkbox"/> Second MA Period [≥1]	20	10	10	200
<input type="checkbox"/> First MA Method	Simple	Simple		Exponential
<input type="checkbox"/> Second MA Method	Simple	Simple		Exponential
<input checked="" type="checkbox"/> ADX Period [≥1]	22	1	10	200
<input checked="" type="checkbox"/> ADX Trigger Level [≥0]	35	10	10	90
<input type="checkbox"/> Position Action At Trend Cha...	Keep All Positi...	Keep All Positi...		Keep All Positi...

At the bottom right are three buttons: 'Load', 'Save' (highlighted in blue), and 'OK' (highlighted in blue). There are also 'Cancel' and 'Reset' buttons.

To produce a useful calibration file by determining which parameters have to be optimized and their range (and steps), you have to proceed with common sense and by knowing the EA itself behavior and logic.

After parameters and values are decided, you can create the calibration .set file by clicking the **Save** button:

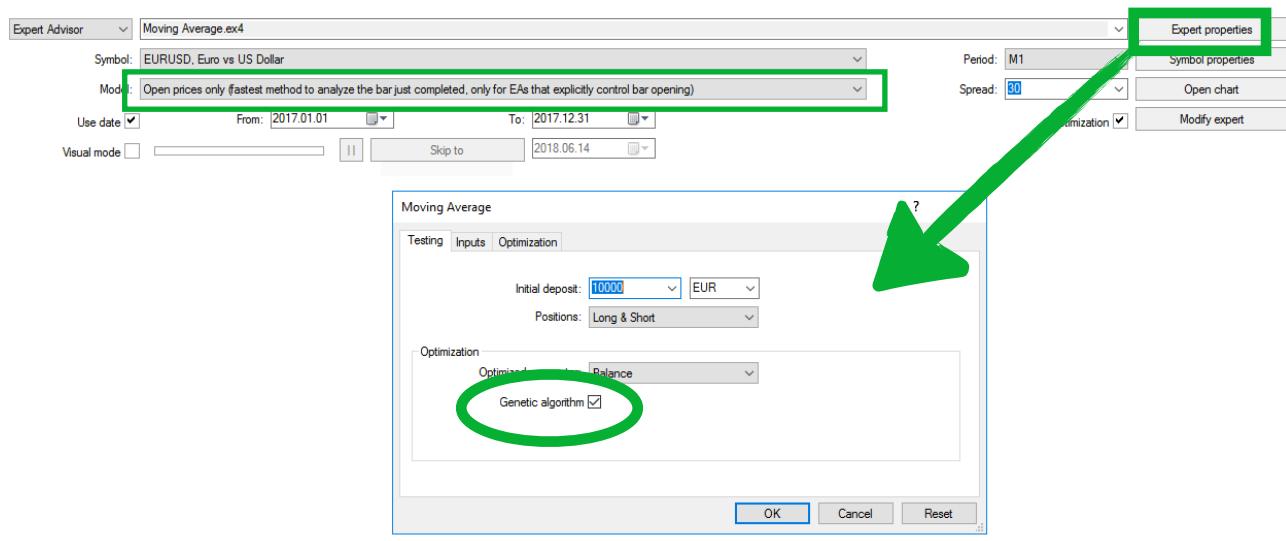

It's important to rename the file in a useful way like "MyEAcalibration01.set" in order to be able to detect it again when and if needed.

## STEP 2: FIND THE BEST “CROSS SETUP” TO RUN YOUR EA

In order to move through all next optimization steps, the first question you need to answer is:

“Which symbol and timeframe my EA will work better with?”

If the EA’s producer doesn’t provide this information, you’ll have to answer by yourself.

To correctly answer this first question by using the Backtester Tool you have to:

1. Create your own symbol list (list of symbols that you want to run the EA with), a timeframe list and an historic data range to run tests. *For example: from 2017-01-01 to 2017-31-01; EURUSD, EURJPY and EURGBP; M1, M5, M15, H1 and H4 (3 symbols x 5 timeframe = 15 Genetic Algorithm Optimizations to run from 2017-01-01 to 2017-31-01)*
2. Load the calibration .set file you produced in the STEP 1 into the **Inputs** tab in order to run all Genetic Algorithm optimizations needed

(in our example: 7 optimizations) in that given data range with the ***Open prices only*** method

3. Select within the Backtester Tool settings the first symbol + timeframe combination. *For example EURUSD + M1 from 2017-01-01 to 2017-31-01*
4. Click ***Start*** to run the first Genetic Algorithm optimization and wait the process ends

You'll have to run a Genetic Algorithm Optimization for every single CROSS SETUP (symbol + timeframe) in your list.

For every tested CROSS SETUP, select the ***Optimization Result*** tab, sort passes by ***Profit*** and take note of the best profit result (pass number and settings).

Pass	Profit	Total trades	Profit fact
69	838.15	89	
34	849.12	84	
71	686.93	61	
70	555.15	70	
47	570.51	127	
68	475.84	121	
63	447.09	100	
64	410.30	80	
52	346.67	112	
54	238.94	96	
42	150.21	100	

Compare the best result out from every Genetic Algorithm CROSS SETUP optimization and you'll be able to find where (symbol + timeframe) the given EA is better performing: this is the “winner” CROSS SETUP. From the step 3, you'll actually work on finding the best parameters' values to use in your EA on that single CROSS SETUP.

## STEP 3: FIND THE “LARVA” SETTING

Select again the winning CROSS SETUP (symbol + timeframe), reduce the testing data range of 1/4 (in this example from 2017-1-1 to 2017-30-9) and run again the Genetic Algorithm optimization to get the updated results. You'll find them listed in the ***Optimization Results*** tab. To each pass number, corresponds a different parameter set related to the profit it would have generated if it was used on that particular EA, on that symbol and timeframe, on the given historical period taken into account.

Sort the ***Optimization Results*** by profit and find the most profitable result; now you're going to re-test setting that performed so well.

The expectation is that a new and more accurate ***Every Tick*** model backtest, based upon the updated settings applied at the same symbol, timeframe and date range, would give back a very similar profit.

In order to re-test the most profitable result, right click on it > ***Set Input Parameters***. This is the fastest way to replace the original calibration settings values (Value column) with the new so well performing setting ready to be retested with the ***Every Tick*** model.

A screenshot of a software interface titled "Tester". At the top, there's a menu bar with "File", "Edit", "View", "Tools", "Help", and a "Tester" icon. Below the menu is a toolbar with icons for "New", "Open", "Save", "Print", "Exit", "Copy", "Paste", "Delete", "Select All", "Find", "Replace", "Properties", "Help", and "About". The main area is a table titled "Optimization Results". It has columns: Pass, Profit, Total trades, Profit fact..., Expected Pay..., Drawdown \$, Drawdown %, and Inputs. The "Profit" column is highlighted with a green border. The first row shows a profit of 838.15. A context menu is open over this row, with the "Set Input Parameters" option highlighted. Other options in the menu include "Copy", "Copy All", "Save as Report", "Skip Useless Results", "Show Input Parameters" (which is checked), "Auto Arrange" (which is checked), and "Grid". The "Inputs" column for the first row shows the value "4.65 TakeProfit=50 StopLoss=95; Inv... ss=95; Inv...". At the bottom of the table, there are tabs for "Settings", "Optimization Results" (which is selected), "Optimization Graph", "Results", "Graph", "Report", "Journal", and "Help".

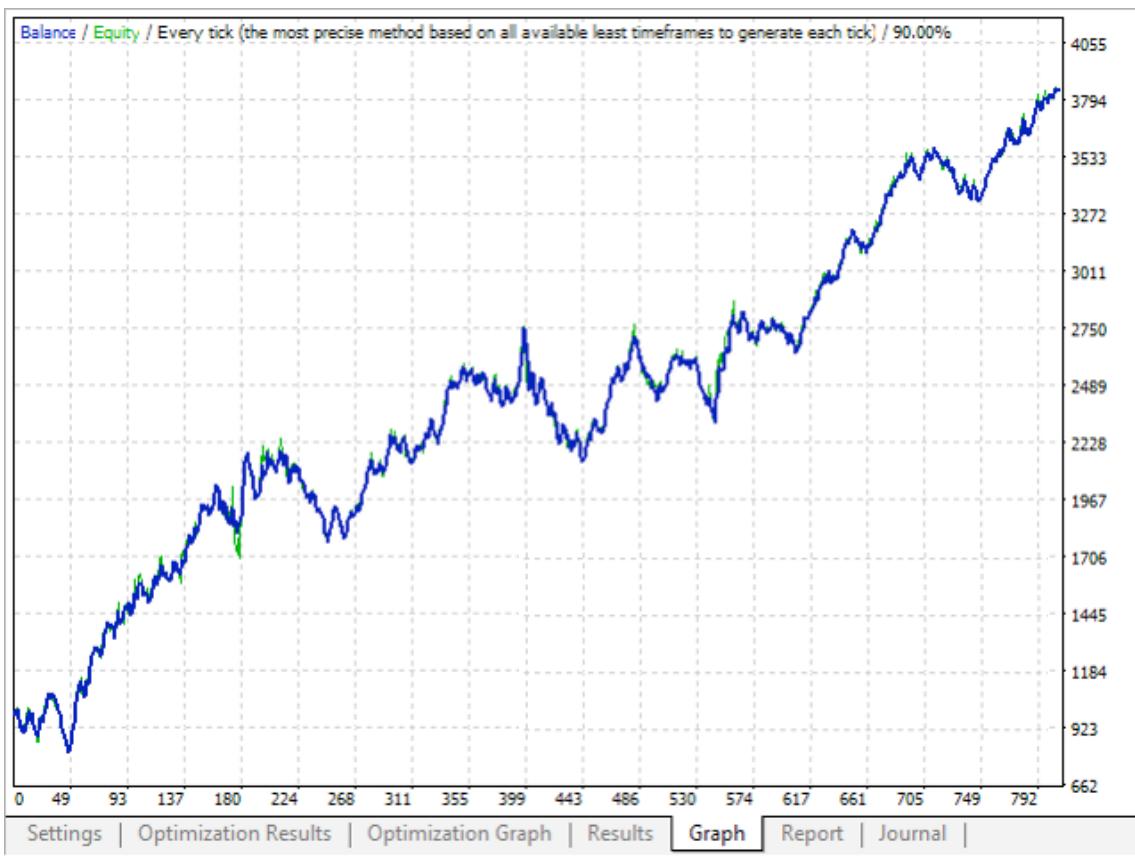

Pass	Profit	Total trades	Profit fact...	Expected Pay...	Drawdown \$	Drawdown %	Inputs
69	838.15	89	1.36	9.42	489.80	4.65	TakeProfit=50 StopLoss=95; Inv... ss=95; Inv...
34	849.12	84	1.31	10.11	612.76		
71	686.93	61	1.31	11.26	593.47		
70	555.15	70	1.24	7.93	572.23		
47	570.51	127	1.20	4.49	637.69		
68	475.84	121	1.18	3.93	661.47		
63	447.09	100	1.16	4.47	628.19		
64	410.30	80	1.16	5.13	672.49		
52	346.67	112	1.12	3.10	520.61		
54	238.94	96	1.08	2.49	745.09		
48	169.24	120	1.06	1.41	502.42		
28	178.37	94	1.06	1.90	735.22		

Now, click the ***Optimization*** button to uncheck it (this is to avoid a new optimization process takes place); then, from the ***Model*** menu, select

**Every tick.** Just click **Start** to launch the test and wait for it has been concluded.

What you would see at the end of the Every Tick test is:

- a nice upward equity curve without extreme drawdown and
- a very similar profit, really close (max 2% for pejorative difference) to the profit achieved during the Genetic Algorithm optimization test by the most profitable result in the **Optimization Results** tab

If any of these 2 conditions is not respected, come back to the **Optimization Results** tab, select the next best profit pass from the list and repeat the Every Tick test. If needed, repeat the process again using other top results until both conditions will be respected and you'll get the definitive LARVA setting (the **Value** column settings are those that signify). Save this setting including the "LARVA" term in the file's name and move on!

## STEP 4: GET YOUR “BAIT” .SET FILE

BAIT .set file is your real starting point to move towards the Holy Grail setup file discovering. Basically, it's the same of the *Calibration* .set file but characterized by highly reduced ranges for *to-optimize parameters* (the “checked” parameters). The purpose is to use new tighter setting BAIT values to run a second, more accurate, Genetic Algorithm optimization.

The way you're going to reduce the *to-optimize parameters* values range is typically based on common sense, but it could be calculated in the way that follow.

Let assume that, in your LARVA setting file, the ***First MA Period [≥1]*** parameter in the Value column is 170: what you have to do is to tune ***Start***, ***Stop*** and ***Step*** values on it.

***Start*** and ***Stop*** would have to differ about 15% / 30% of the original value, while the ***Step*** value has to divide the “Start-to-Stop range” into about 15 / 30 segments.

In this example, for a 170 value with a deviation of 20% (20% of 170 = 34, which is close to 30) and 20 steps:

- ***Start*** would be something like  $170 - 30 = 140$
- ***Stop*** would be something like  $170 + 30 = 200$
- ***Step*** is  $(200-140):20 \text{ steps} = 60:20 = 3 \text{ steps}$

Variable	Value	Start	Step	Stop
<input type="checkbox"/> ===== Indicator And Trading ...	=====			
<input checked="" type="checkbox"/> First MA Period [≥1]	170	140	3	200

Apply the same approach to all *to-optimize parameters* to reduce the “Start-to-Stop range”. This is a very mechanical step, but it's crucial to move towards the Holy Grail setup file finding.

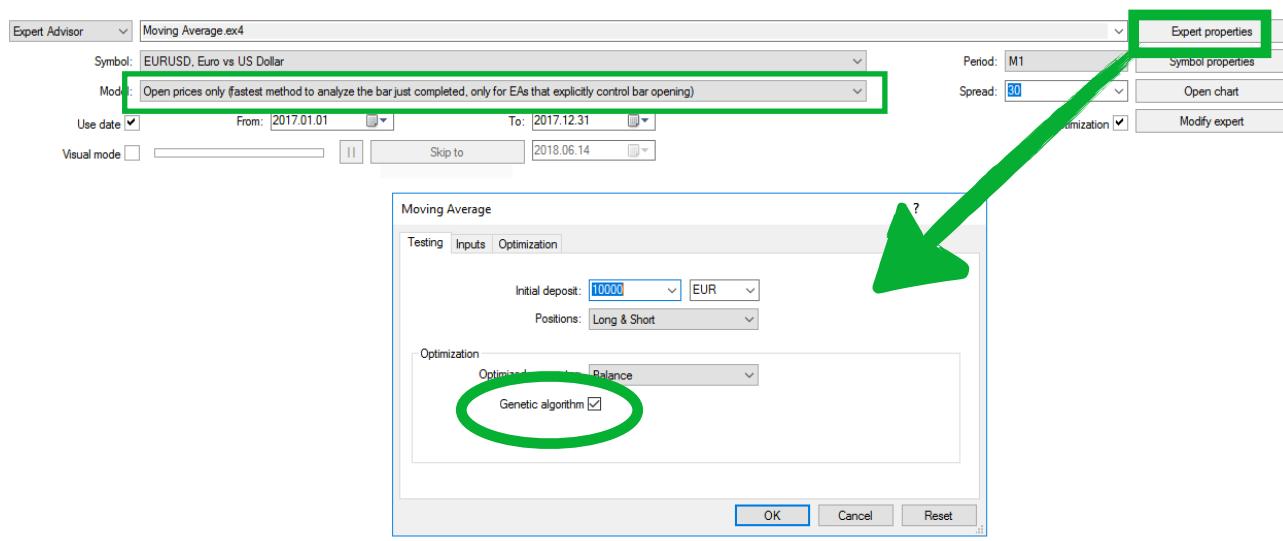

When all ranges will be reduced, save this setting including the “BAIT” term in the file's name.

## STEP 5: GET YOUR “YEPPA!” .SET FILE

YEPPA! .set file is a new version of the previous BAIT file. The only difference is that you'll remove combination of values that would anyway decrease profit performances in the second and more accurate Genetic Algorithm optimization process.

To do that, you'll put in competition couples of parameters through intermediate NON Genetic Algorithm optimization passes. It's harder to say than done.

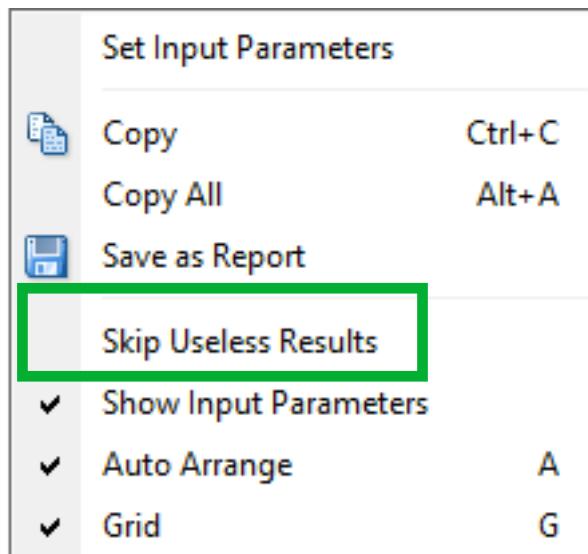

First of all, uncheck the Genetic Algorithm option in the ***Expert properties > Testing*** tab and select the ***Open Prices only*** mode

Then, in the ***Input*** tab, leave checked only the first 2 *to-optimize parameters* (and uncheck all others).

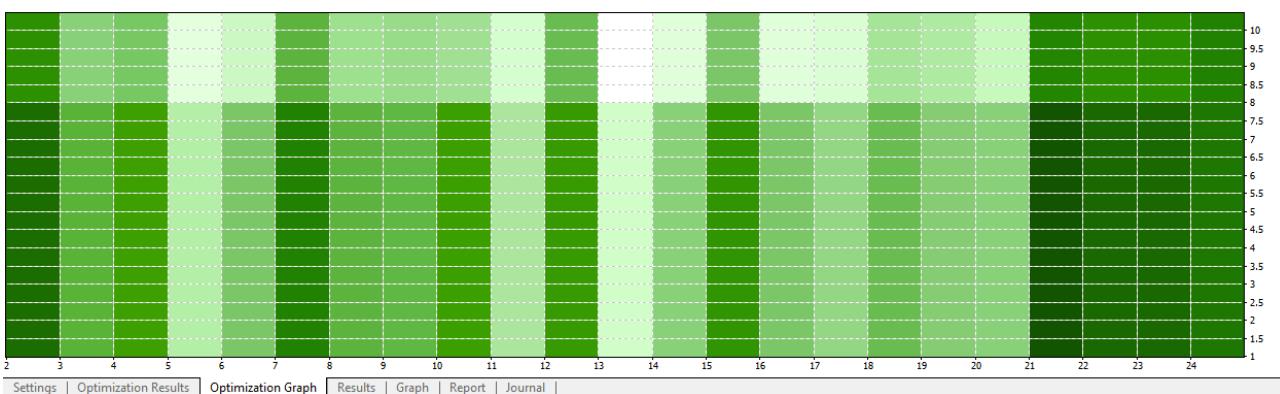

Variable	Value	Start	Step	Stop
===== Indicator And Trading ...	=====			
<input checked="" type="checkbox"/> First MA Period [≥1]	170	140	3	200
<input checked="" type="checkbox"/> Second MA Period [≥1]	20	10	2	30

Be sure you're able to see every single optimization result: in the **Optimization Result** tab, right click to be sure that **Skip Useless Results** is unchecked. Please, note that some time you would have to launch the optimization by clicking the **Start** button before to be able to access the **Optimization Result** tab and uncheck that parameter: in this case, simply stop the optimization process, uncheck it and restart.

Launch the optimization through the **Start** button.

After the process ends, go at the **Optimization Graph** tab, right click and select **2D Surface**: you'll get a graphic like this:

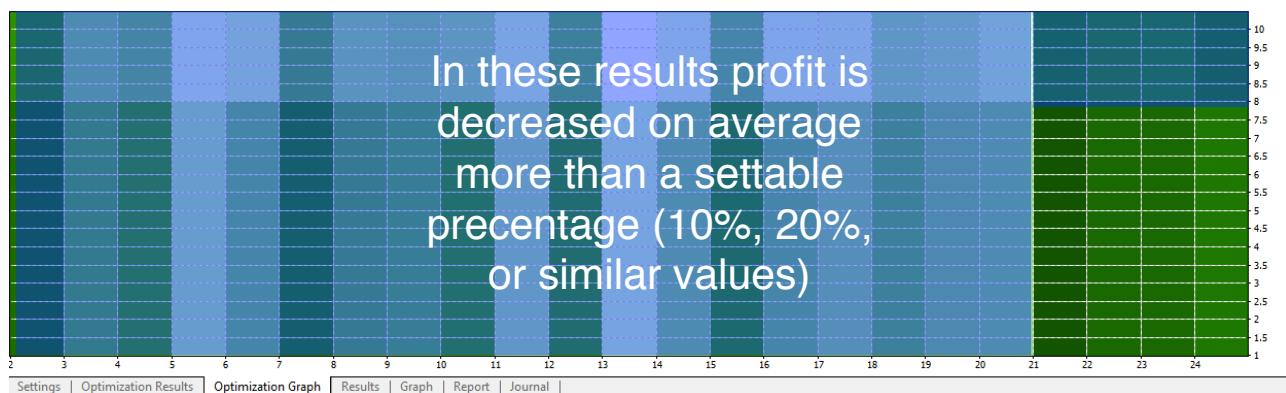

This picture represents a Cartesian graph. On X axis you can find the 1st *to-optimize parameter* and on Y axis you can find the 2nd *to-optimize parameter*. Darker rectangles are where the 2 parameters returned better profit performances while clearer are where the 2 parameters

returned worser profit performances (you're able to access the profit records simply by stilling the mouse arrow over any rectangle).

Looking at the 2D surface, you'll be able to find the “best-performance-rectangles” zone: it is where you can see the highest concentration of darker rectangles. Some times you could find more than 1 single “best-performance-rectangles” zone; in this case simply select the wider one to keep on in the optimization process.

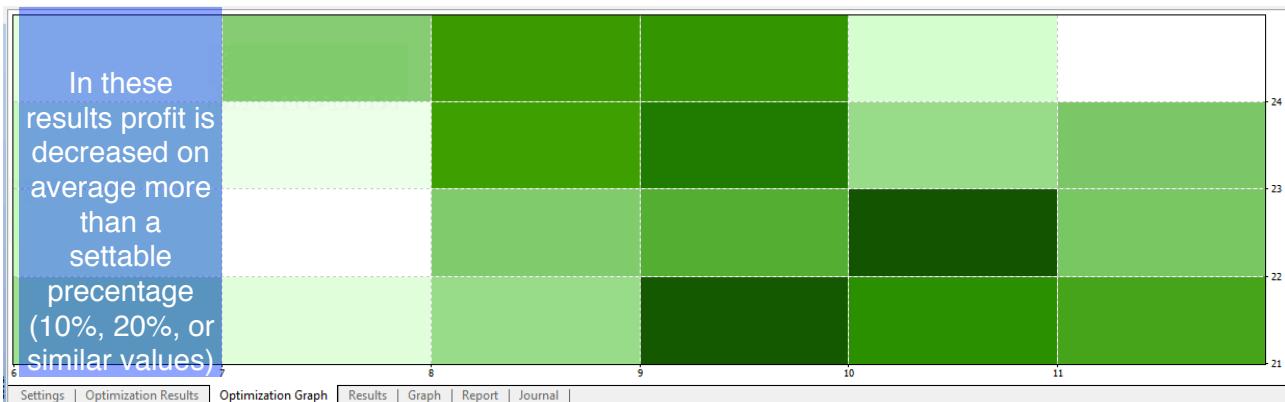

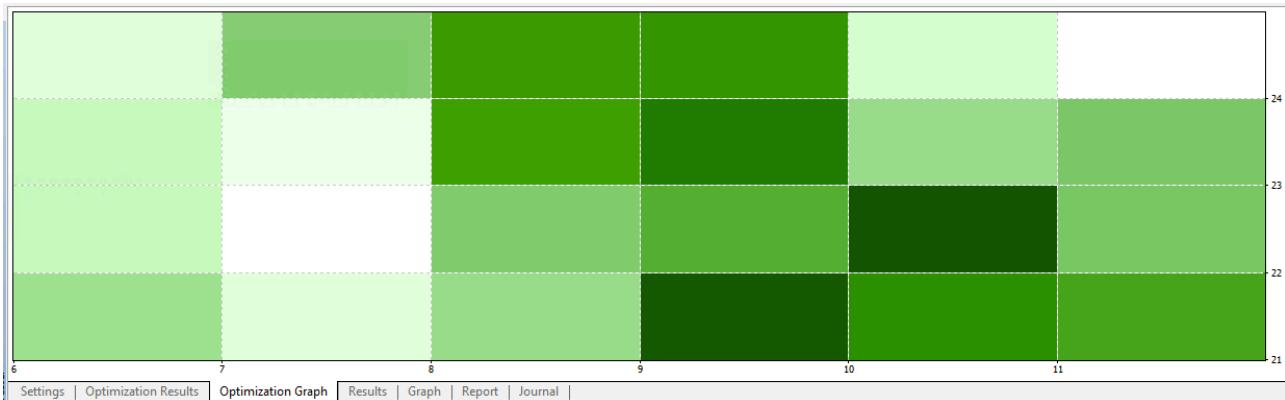

Take note of the X or Y parameters that produce entire lines or entire columns with worser profit (let's say 10% or 20%); then simply come back to the ***Input*** tab in the Expert properties and remove values starting from them, from “Start-Stop ranges”. Please, note that a single profitable result close to the “best-performance-rectangles” zone makes the entire line or column as valid one; on the contrary, one or more profitable results away from that zone will invalidate it.

Backing to our numeric example (in true not related with the picture example), if the 2d Surface lets you know that ***First MA Period [≥1]*** = 140, 150 and 160 returned worser profit performances (clearer rectangles on entire lines or columns), just reduce the 140-200 range to a new 170-200 range by simply changing the ***Start*** value from 140 to 170.

Repeat the process for every couple of parameters and reduce related value ranges to avoid couples of parameters that give back pejorative profit performances.

Another visual example could help for sure.

BEFORE

<input checked="" type="checkbox"/> MovingPeriod	12	21	1	24
<input checked="" type="checkbox"/> MovingShift	6	6	1	11

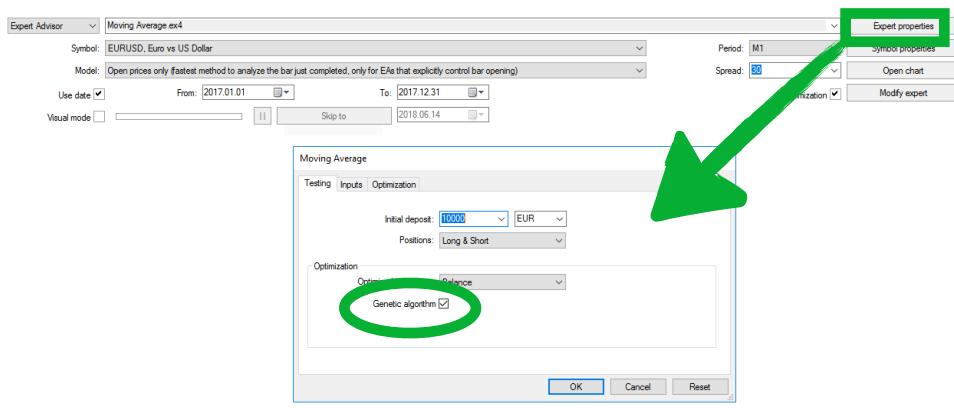

AFTER

<input checked="" type="checkbox"/> MovingPeriod	12	21	1	24
<input checked="" type="checkbox"/> MovingShift	6	7	1	11

When all couples of parameters will be checked and pejorative values will be removed, save this setting including the "YEPPA" term in the file's name. Now we're ready to launch the more accurate Genetic Algorithm optimization and move ahead.

# STEP 6: FIND THE ROBUST-CLOVERS FIELDS

It's time to launch the new Genetic Algorithm with the new YEPPA! setting. Check again the Gen. Alg. option in the ***Expert properties > Testing*** tab and click ***Start*** to launch it (***Open prices only*** mode; ***Skip Useless Results*** unchecked; same 3/4 of the original data range -the same you used in the STEP 3 - )

At the end of this Genetic Algorithm optimization, you'll find the usual results list. Every pass ID corresponds the setting parameters responsible for its specific Profit and Drawdown backtest result.

Pass	Profit	Total trades	Profit factor	Expected Payoff	Drawdown \$	Drawdown %
④ 4561	4658.89	289	1.50	16.12	596.32	44.95
④ 4731	4631.49	287	1.49	16.14	615.32	45.62
④ 5102	4590.49	289	1.49	15.88	620.32	45.65
④ 4296	4565.21	293	1.48	15.58	610.32	43.90

④ 5255	4410.42	292	1.46	15.10	681.72	44.02
④ 4909	4409.89	295	1.47	14.95	540.85	42.94

A good idea could be to export all these datas to an Excel file before to move on: just right click on the ***Option Results*** tab > ***Copy All*** and paste on an Excel file.

Sort them by profit and sharpen your sight to detect RANGE GROUPS of settings, that have contiguous Pass IDs (**Pass** column) and are composed by at least 2 very, very similar profit results (differing from 0% to 2% each other) with acceptable drawdown - based on your own acceptability criteria- . Scroll down and try to find at least 10 RANGE GROUPS.

The following tables could help in understanding:

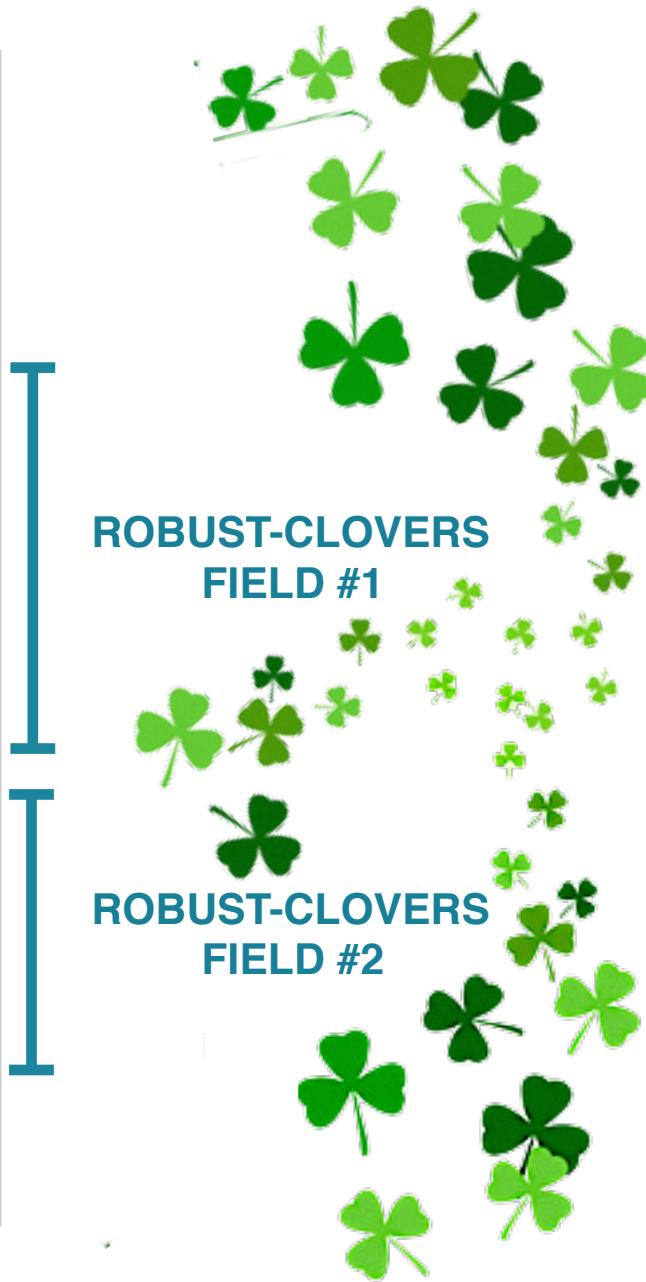

Pass	Profit \$	Drawdown %
4773	12215.36	10.10%
4819	12215.35	10.10%
4801	12214.82	10.10%
4758	12214.80	10.10%
4792	12214.80	10.10%
4826	12214.78	10.10%
4903	12214.54	10.10%
5072	12213.42	10.10%
5045	12213.12	10.10%
4650	12209.76	9.88%
4668	12209.76	9.88%
4639	12209.63	9.88%
4615	12209.25	9.88%
4691	12209.06	9.88%
4017	12208.97	9.88%
4711	12208.83	9.88%
4502	12208.59	9.88%
4784	12208.44	9.88%
4798	12208.10	9.88%

Take notes of the Pass IDs. Please note that, for optimal result, it's crucial that different groups' pass ID numbers (and so settings values) would differ as much as possible each other.

- RANGE GROUP 1: from 4819 to 4826
- RANGE GROUP 2: from 4784 to 4801
- RANGE GROUP 3: from 4639 to 4668
- .... RANGE GROUP 10: from .... to .....

Now, you have to sort the Optimization Results by **Pass ID** and locate that 5 (or more) contiguous passes, near these group ID ranges, that still provide similar strong profit and drawdown results (differing from 0% to at least 5% or 10% each other).

<b>Pass</b>	Profit \$	Drawdown %
4810	1926.64	13.95%
4811	12190.28	10.10%
4812	1865.08	35.09%
4813	12037.69	10.07%
4814	1830.66	14.67%
4815	11765.54	10.18%
4816	12154.95	9.91%
4817	12112.61	9.99%
4818	11484.92	10.25%
4819	12215.35	10.10%
4820	11221.45	10.04%
4821	12072.69	10.20%
4822	7222.97	28.09%
4823	11770.72	10.51%
4824	12074.32	10.15%
4825	12076.02	10.18%
4826	12214.78	10.10%
4827	11497.05	11.09%
4828	6402.52	26.87%
4829	9219.68	22.13%
4830	9377.62	20.72%

Let's try looking at the ■ RANGE GROUP 1 (passes from 4819 to 4826 - of course, your eyes will see also adjoining Pass IDs-) trying to detect as many ROBUST-CLOVERS FIELDS as possible, composed by 5 (or more) contiguous passes that provide similar strong profit and drawdown results. Apply the same procedure to all other RANGE GROUPS and find out as many ROBUST-CLOVERS FIELDS you can. Take notes of them.

## STEP 7:

# COLLECT A BOUNCE OF FOUR-LEAF CLOVERS

<b>Pass</b>	Profit \$	Drawdown %
4810	1926.64	13.95%
4811	12190.28	10.10%
4812	1865.08	35.09%
4813	12037.69	10.07%
4814	1830.66	14.67%
4815	11765.54	10.18%
4816	12154.95	9.91%
4817	12112.61	9.99%
<b>4818</b>	<b>11484.92</b>	<b>10.25%</b>
4819	12215.35	10.10%
4820	11221.45	10.04%
4821	12072.69	10.20%
4822	7222.97	28.09%
4823	11770.72	10.51%
4824	12074.32	10.15%
<b>4825</b>	<b>12076.02</b>	<b>10.18%</b>
4826	12214.78	10.10%
4827	11497.05	11.09%
4828	6402.52	26.87%
4829	9219.68	22.13%
4830	9377.62	20.72%

In every ROBUST-CLOVERS AREA you'll be able to find 1FOUR-LEAF CLOVER.

The FOUR-LEAF CLOVER is the Pass record that exactly stay at the middle of a ROBUST-CLOVERS FIELD: its relative position tells us that this is a very robust setting that will probably work fine also in slightly different market condition than in the testing data range.

Consider that you'll find at least 1, 2 or 3 FOUR-LEAF CLOVERS for every RANGE GROUP you detected in the STEP &.

The good new is that, among these 10-30 settings, you're going to shortly discover the HOLY GRAIL setup you're hardly looking for.

## STEP 8: FIND THE TOP 1 TO 3 FOUR-LEAF CLOVERS

Now you have to re-test every single FOUR-LEAF CLOVERS setting you found in the previous step. To speed up the copy/paste setting operation, you could use the **Set Input Parameters** right click option in the **Optimization Results** tab.

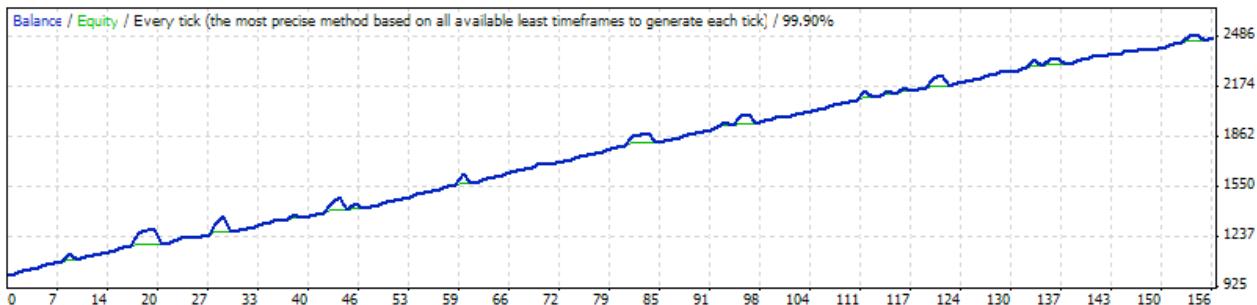

Please put your attention at the following points:

- Click the **Optimization** button to uncheck it to avoid a new optimization process takes place
- Use the last 1/4 data range (in our example, from 2017-1-10 to 2017-31-12)
- From the **Model** menu, switch back to the **Every tick** model to increase the accuracy of testing

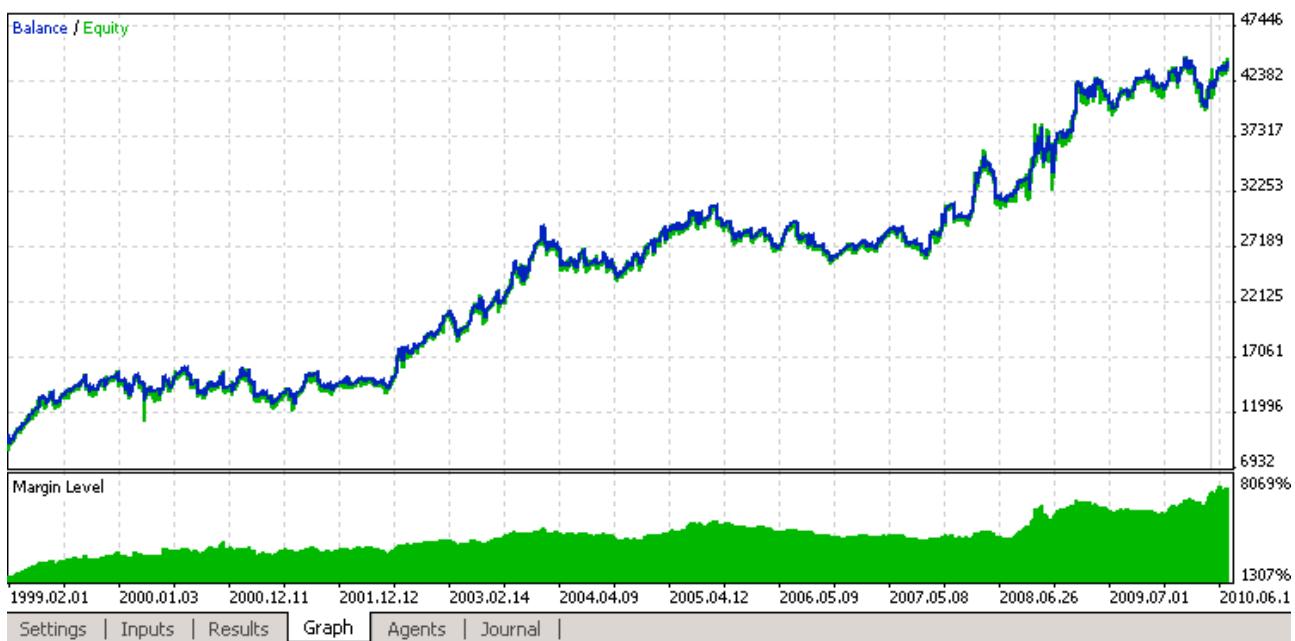

The expatiation is to get very profitable results, with very good graph showing constant earning and low drawdown, running the strategy on historical datas (on a different data range) we didn't use to perform the optimization.

Please, note that drawdowns are important parts of a winning strategy: get away from over-hyper-optimized parameters that typically are unable to keep performing well in the future; at the same time try to keep your drawdown under 15% value if possible.

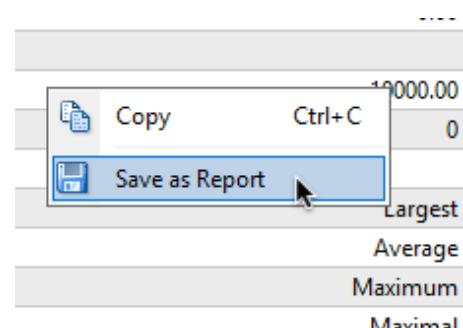

## Typical backtest graph to escape from:

## Typical backtest graph to look for:

At the end of every pass, right click in the **Report** tab to save the current report and graph. It's recommended to also save the related .set file in the directory where you saved the report.

Now, by comparing the saved reports, based upon your profit and drawdown expectations, you'll be able to select the TOP 1 to 3 FOUR-LEAF CLOVERS settings that you're going to run in live DEMO test.

## STEP 9: DISCOVER THE TRUE HOLY GRAIL SETUP

Now, TOP 1 to 3 FOUR-LEAF CLOVERS settings have to be run in live accounts: the suggestion is to use 1 account per every single FOUR-LEAF CLOVER setting because it will be much easier to analyze performances of each tested setting. Be sure to test them in parallel, at the same time, in DEMO accounts for the next 4 “quarantine” weeks and find out among them the best performing one:

### THE TRUE HOLY GRAIL SETUP

## STEP 10: 🔥 THE TEST OF FIRE

After the 4 “quarantine” weeks period, test it for the last time in a REAL account for 2 more weeks using minimal lot sizes (as smaller as possible) to be sure it is performing as expected before to entrust to it your real, big money.

IF the strategy keep performing as in the “quarantine” weeks period, then you’ve the green light to start investing your real, big money, in this strategy.

Note that it’s not a good idea to put all your eggs in a single basket. The best practice could be to create your own EA strategies portfolio so, if you’re sure all is working fine with the Holy Grail, my advice is: let’s invest in it just a portion of your money, in a dedicated trading account.

In the meanwhile, just simply pick up a new EA and run it through all these 10 steps finding a new HOLY GRAIL - CROSS SETUP - EA to add your portfolio at.

# EPILOGUE (REPETITA IUVANT)

Many and many more steps could be added while researching the Holy Grail setup. However, these 10 are enough to start your “holy search” being sure you’re traveling in the right direction.

Anyway, my advice is to go through all these 10 steps at least a couple of time; after that, i encourage you to optimize this step-by-step strategy with your own devices and share with our [FREE FOREX BACKTEST COMMUNITY @ http://tiny.cc/ForexBacktest](http://tiny.cc/ForexBacktest) your updated procedure and the results you’re achieving with it.

**Just a prayer: please spread this ebook to the world by sharing it with all your forex trader friends and in every forum or community you frequent; this will let find better, more robust and even more profitable free forex strategies to share in the group, for the benefit of everyone!**

*Have a good backtesting and Forex money making!*

With Love!

*Francesco Nano from Italy*
